When I finish my schooling, I dream of becoming a computer engineer. I'm also keen on working on projects that have a positive impact on society, like developing computing solutions for healthcare, education, or environmental sustainability. This job involves designing, developing, and testing computer systems and components such as processors, circuit boards, memory devices, networks, and routers. The salary for computer engineers can vary widely depending on their experience, location, and the industry they work in. However, according to my research, starting salaries for computer engineers are generally high compared to many other professions, and there is great potential to earn more as one gains experience and takes on more complex projects. Ultimately, I aim to be a computer engineer not just for the exciting challenges and the potential to live comfortably, but to innovate and create technologies that can improve people's lives and help address societal issues. I will work on creating new hardware that can perform specific tasks or work with software developers to make sure their programs will run smoothly on the hardware I design.
