

Scientists around the world are doing their best to ensure that they will work differently too. Other options include replacing a car's sunroof with a panel which has organic solar cells within it. These are electric cars, which use electric energy stored in rechargeable batteries, or hybrids, which use a combination of petrol or diesel with an electric motor. Cars which use more sustainable energy are gradually replacing traditional petrol or diesel powered cars. The car has photovoltaic (PV) cells in solar panels, which are made of silicon. These convert the sun's energy into electrical energy
