

It's very important to develop technology to benefit from it. Some people think technology should focus on building spacecraft. Others think building robots is more important. Developing spacecraft is important for space explorers. But it costs billions of dollars more than building the most complex robot.

People who support space exploration think it is the origin of life in the universe. Although this knowledge is amazing, there are no practical uses of it for people now. Modern robots can be built much cheaper than spaceships, and they can be used for practical purposes on Earth. People can benefit from robots. They can work in extremely dangerous conditions. They can take apart bombs, perform hard surgery, and do housework too. To sum up, it's better to give due care, time, and money to develop robots as they are cheaper to develop and more useful than spacecraft.
