

Dear X somewhere, sometime will be able to read it.

At first, But they were soon everywhere. Some of the earliest thinking machines were used to control the temperature. When it was too cold, they turned up the heat and when it was too warm, they turned on the air conditioner. This doesn't sound too dangerous, but once people got used to have temperatures controlled and then lights being controlled, fire sprinklers and many household appliances. It was great! People had more free time! Well, only rich people had more free time.

Of course, it was only natural that the technology have-nots would want more. Soon, they started stealing from and rebelling against humans with technology. People installed security systems in their homes and business. Computers used video cameras to watch everything and everyone.

While all this was going on, two other lines of research were being pursued in artificial intelligence laboratories.

One area of interest was robots that could recreate themselves. The plan was to send them planet, like Mars, No one ever thought of what would happen if they escaped their labs on Earth. The other research direction was in parallel processing.

One of the real problems was the whole idea of remote control.

I left the city, moved into a cave high in the mountains and started growing my own food and ?making everything I need by hand. Eventually, of course, And what did they need humans for
