

Classification of snail Kingdom: Animalia Phylum: Mollusca Class: Gastropoda Order: Stylommatophora

Family: Polygyridae Genus: Fumonelix Species: Fumonelix archeri Are there poisonous types of

snails? Snail is an important part of the ecosystem, as it plays a role in improving soil quality through the

process of mucus secretion, improving ventilation and soil stability. Snails are found in various marine

and land habitats, including seas, oceans, lakes, rivers, and forests. The snail lives in almost all

environments, but mostly in fresh and salty water as well as in drylands, being the only group of

molluscs with the property of adapting to diverse environments on Earth. Snails are intermediate hosts

for parasites, causing a disease called schistosomiasis. There are more than 600 species of poisonous

?! cone snails around the world
