

The data indicates that 42.5 of actors changed the type of food they order after the COVID- 19 epidemic. This could reflect a shift towards healthier options or different preferences grounded on their gestures during the epidemic, similar as increased health mindfulness or life changes. Meanwhile, the larger chance(57.5) who did n't change their food choices may reflect a durability of their former preferences or a lack of significant impact from the epidemic's changes. The lower chance(42.5) who changed the type of food they order indicates a shift in eating actions towards different or healthier options after the epidemic.
