

The statement that the number of males at birth is consistently higher than the number of females is not entirely accurate. For example, in some societies, there may be a preference for male children, leading to higher rates of sex-selective abortions or other forms of gender discrimination. It's important to note that the sex ratio at birth is just one aspect of the overall population sex ratio, which can be influenced by various factors such as life expectancy, migration patterns, and gender-specific mortality rates across different age groups. In general, slightly more males are conceived than females, but there is a higher rate of male fetal mortality during pregnancy.
