

Risk of Cloning: There have been multiple arguments both for and against the process for plant, animal, and human cloning. The risks involved in cloning plants are risks that hopefully can be prevented. It is unknown if a cloned plant can reproduce naturally, without growth we are at risk of losing species completely. Facts on the Risks of Cloning Plants: The cloning of plants is not nearly as risky as that of animals and humans, It does have some risk involved. There is a risk of loss of genetic variation in the future and risk of DNA diversity. It is helpful to know that nature already clones itself in some plant life. 1.2
