The ViewDeleteRequestFragment is an Android Fragment which is utilized to display details of a budget request and delete it. It defines several TextView objects to display various details like budget ID, name, moment, and status.Within the onCreateView method, the fragment_view_delete_request layout is inflated, and UI objects are initialized using findViewById.Also, the onResume method populates the TextView fields with their respective budget information from a shared data source, e.g., PassData.budgetModel.This function copies the customer_id from shared preferences and, using the HttpConnection class, makes a delete request with the corresponding budget_id and customer_id.If the delete button is clicked, it will show a confirmation dialog via the createDeleteDialog() function.
