The beak of the African gray parrot is black in color, and on the white skin devoid of feathers surrounded by pale yellow eyes, and the face there is a wide area of African gray parrot of the male and female are similar in appearance, but the male can be identified through the dark gray or black eye, with the ends of the tail Dark red. Wonderful facts about the African gray parrot About Gray African Parrot Two types of gray African parrot have been identified. The first type is the African gray parrot with a red tail, or the African Congo parrot, and the other type is the African gray parrot to the right, but it is now believed that the African gray parrot is dominated by a separate species. Gray African Macaw with biological properties: The African gray parrot feeds on a variety of fruits, seeds and nuts, especially from guinea fats. It is also known about the African gray parrot that destroys corn crops, and the African parrot species can travel great distances in search of fruit trees. Wonderful facts about the African gray parrot About Gray African Parrot The African Gray Parrot often flies in large swarms, and forms a large noisy group on the branches, and the African Gray Parrot birds invite each other with a variety of shouts, whistles, and screams, whether at rest or in flight, in addition to their ability to imitate human speech This African parrot has been found to mimic other birds and speak to mammals in the wild. The home of the African gray parrot: The African gray parrot is widely found across tropical Africa from southeastern Côte d'Ivoire in the east to Kenya and Tanzania, and south to Angola, and was also found in the islands of Principe and Sao Tome. Habitat of the African Gray Parrot: The African gray parrot inhabits both the main and secondary forests with low humidity. The African gray parrot has also been seen at the edges of forests and sometimes in mangrove forests, savannah forests, and in cultivated areas. Often, the African gray parrot is found in areas of palm trees that he likes to feed on, and spread Usually on the marine islands. The African gray parrot is at risk of extinction: Wonderful facts about the African gray parrot About Gray African Parrot The loss of habitat, especially the loss of large nesting trees, is likely to have a major impact on the African gray parrot groups, however the main threat is the seizure of large numbers of wild African gray parrot members in the international pet trade. It is estimated that up to one fifth of the number of African parrot birds in the world can be harvested annually to be sold as pets despite actual numbers captured are likely to be higher than those officially recorded, due to the number of birds that die during capture or during Transport . It is a matter of concern that there is also a market for the heads of African gray parrot and tail feathers, which are harvested for alleged medical purposes, and that are easier to store and transport than live birds. Keeping the African gray parrot safe from extinction: The gray African parrot is still widespread and is found in a number of protected areas such as the Salonga National Park in the Democratic Republic of the Congo, and this park is a World Heritage site and is considered the largest tropical rainforest reserve in Africa, however, despite the trade being monitored to Somewhat within the framework of the International Trade Agreement for Endangered Species of

Animal, the current levels of the African gray parrot are considered to be unstable and declining. The rules for preserving the gray African parrot include reducing the quotas and banning the exports of budgies from some countries, and trying to impose trade controls. The import of the African gray parrot that was previously caught in the United States of America and Europe has been banned, and this may help lower the level of trade for this bird Very smart
