

This is an excel sheet with the results of some lotto draws let's say it's a collection of historical data as many past 6/49 results;so first i want to you calculate how often each numbers from 1 to 49 has been drawn .some numbers will naturally occure more frequently than others overtime but that doesn't imply they are ""lucky""or due appear,secondly hot vs cold numbers.then examine number pairs and groups(common pairs-adjacent numbers).after that odd and even analysis;also calculate the sum of the numbers in each draw and check it if there is common range,check for consecutive numbers ;identify if certain numbers or numbers patterns from previous draws are repeated in following draws ;analyse time gaps how long it's been since certain numbers have bee, drawn;and please avoid clustersof numbers;finally I put all my trust in you and rely on you greatly and expect good and honorable results from you by choosing lottery numbers and better statistical advantage over random selection
