

The harm of AI can be mitigated by a series of integration strategies focused on improving the use of this technology. This includes retraining programs for workers to acquire the skills needed to meet future challenges stemming from automation and innovation. This can be achieved through ongoing training programs and interactive workshops that focus on the skills needed to deal with AI technology. To do so, we need to establish strict policies to protect personal data and ensure that AI systems are in line with global security standards. First, it is important to promote education and awareness about AI. This helps individuals and employees understand how these systems work and have potential impacts. Second, efforts are needed to ensure transparency in AI algorithms.
