

Dear Editor, I am writing to ask for support in protecting an endangered creature, the tongue-eating louse. It lives in the oceans throughout much of the world, but scientists believe that we should try to save it. However, it isn't as attractive as other endangered creatures, like the Arabian Oryx or Siberian tigers. Scientists are studying them because they want to save them, to keep the sea ecosystem intact. Therefore, if the tongue-eating louse becomes extinct, an important part of the ecosystem of the sea. For example, it has a parasite that survives by living on and feeding off of another creature. Another interesting fact about the tongue-eating louse you can probably guess from its name that the tongue-eating louse eats tongues, specifically fish tongues. I think there is also a medicinal reason we need to check if it can help by using its medicinal properties. As a result, it doesn't get very much attention. In my opinion, the tongue-eating louse is a rare animal that we could learn a lot from.
