

Expressive language disorders are identified through the following traits in children:² In particular, other developmental disorders like autism⁴ and hearing loss commonly co-occur with language disorders.² Likewise, a child with learning disabilities may also live with language disorders.² Aphasia is another condition linked with language disorders. The factors responsible for language disorders are unknown, this explains why they are often termed developmental disorders.² Disabilities or Brain Injury Despite the uncertainty around the causes of these disorders, certain factors have strong links to these conditions. Repeating phrases or questions when answering Causes of Language Disorders With a language disorder, the child does not develop the normal skills necessary for speech and language. Diagnosis of Language Disorders To determine if a child has a language disorder, the first step is to receive an expert's assessment of their condition. For expert guidance, a speech-language pathologist can work with children and their guardians to improve communication and expression. A speech-language pathologist or a neuropsychologist may administer standardized tests. The Link Between Deafness and Language Problems In making their assessment, the health expert will conduct a .hearing test to discover if the child suffers from hearing loss
