

Roller-Compacted Concrete (RCC) pavement is a type of concrete used in the construction of road surfaces and other. The primary goal of using RCC is to provide a durable and strong surface capable of withstanding heavy loads, making it suitable for areas with intense traffic and large-scale projects. This technology is considered cost-effective and efficient, especially in projects that require the rapid construction of extensive surfaces. RCC is utilized in various applications, including airports, ports, and industrial facilities that demand a robust and sustainable base.
