

Iron alloys are important materials in industry, the most prominent of which is steel alloy. Corrosion resistance: Some types of steel, such as stainless steel, contain chromium, which gives it good resistance to corrosion. Steel is an alloy that consists mainly of iron with a percentage of carbon, and often contains other elements such as manganese, chromium, and nickel to improve its properties. Durability: Steel can withstand high temperatures, making it suitable for use in harsh environments. Strength and durability: Steel has high strength, making it suitable for use in construction and machinery manufacturing. Flexibility: Steel can be easily shaped without breaking, making it ideal for many applications. The properties of steel alloys include: 1.2.3.4
