

Global warming refers to the gradual rise in the overall temperature of the atmosphere of the Earth. There are various activities taking place that have been increasing the temperature gradually. Global warming is melting our ice glaciers rapidly. The first step in solving any problem is identifying the cause of the Global warming has become a grave problem that needs undivided attention. The natural causes include the release of greenhouse gases that are not able to escape from the earth, causing the temperature to increase. Furthermore, volcanic eruptions are also responsible for global warming. That is to say, these eruptions release tons of carbon dioxide, which contribute to global warming. Similarly, methane is also a big issue responsible for global warming. After that, the excessive use of automobiles and fossil fuels results in increased levels of carbon dioxide. Switch to a hybrid car and reduce the release of carbon dioxide. Another step you can take is to limit the use of electricity, which will prevent the release of carbon dioxide. China has recently taken the lead in global warming pollution, accounting for approximately 28 percent of total CO2 emissions. The present generation must take up the responsibility of stopping global warming in order to prevent the suffering of future generations. Therefore, every little step, no matter how small, carries a lot of weight and is quite significant in stopping global warming
