In general, treatment for soft-tissue sarcomas depends on the stage of the cancer.A combination of docetaxel and gemcitabine could be an effective chemotherapy regimen in patients with advanced soft-tissue sarcoma.[15][16] Outcomes are better for patients who are seen (and ideally treated) at expert sarcoma centers.[17] In the United States, these are generally found in NCI-designated cancer centersThere is evidence to suggest that doxorubicin chemotherapy as an adjuvant can reduce recurrence at the original site or elsewhere in the body.[14] Evidence also suggests chemotherapy can increase the length of time patients live, but this is less certain evidence.If the cancer has spread to other areas of the body, chemotherapy may be used to shrink tumors and reduce the pain and discomfort they cause, but is unlikely to eradicate the disease.The tumor is removed leaving a safe .margin of surrounding healthy tissue to decrease the chances of its recurrence
