

of new cases and fatalities from gastric cancer continues to rise each year. Despite its high prevalence, most patients are diagnosed at an advanced stage, resulting in a poor prognosis due to the absence of clear clinical indicators. However, in recent years, the widespread use of gastroscopy has led to an increase in the detection of early-stage gastric cancer. Consequently, early detection and treatment are crucial for improving the prognosis of gastric cancer. During the teaching process, it is essential for students to have a thorough understanding of the anatomy of the stomach wall in order to effectively guide gastric endoscopy and surgery based on the stage of the disease.<sup>1</sup> Most significantly, it is essential to avoid
