

It all started in 1969 when a student at the University of Stanford tried to log in to a univent computer, from his home in Los Angeles. This gave scientists the idea that people could communicate through computers, instead of posting letters or talking by telephone. In 1990 Tim Berners-Lee and Robert Dolan succeeded. C Many scientists researched ways to try and do this. They created a system for people to communicate with each other and find out information using computers.
