

BA has always been one of the common health problems linked to adults and children. Other important risk factors for asthma have also been identified as a family history of BA (OR=4.6), allergic rhinitis (OR=3.39), skin eczema (OR=4.6), and recurrent respiratory injuries (OR=4.1) [13]. Nevertheless, 61.4% used inhalers, mostly Ventolin, while 76% showed non-compliance with pharmacotherapy. (REF) Mild intermittent BA affects 69.6%.
