

The dentists in Ancient Egypt were incredibly knowledgeable about various dental diseases that are still prevalent today. They had a deep understanding of dental caries, which is caused by poor oral hygiene and excessive sugar consumption. They were also skilled in identifying and treating periodontal disease, an infection that affects the gums and supporting bones. In cases of severe infection, they were able to drain abscesses to relieve pain and prevent further complications. These ancient dentists were even aware of the consequences of tooth wear, likely caused by abrasive diets and using teeth for tasks other than eating. Their expertise in managing dental diseases was truly remarkable and demonstrated their advanced understanding and treatment methods.
