

Main Results 1.4 –The use of a feeding plate improves feeding outcomes for babies with cleft conditions by stabilizing the oral cavity, allowing for better positioning and support during feeding. **Maternal Knowledge and Support**: The use of custom-made audio-visual educational modules significantly improved mothers' knowledge and practices regarding feeding infants with CLP. Infants with cleft palate experienced significant feeding challenges, including aspiration, choking, and inadequate growth. Mothers who received targeted education reported better adaptation to breastfeeding practices and enhanced understanding of their infants' needs. 2.3..
