

I agree with the statement that AI-driven assessment promotes equity in education. Unlike human educators who may have unconscious biases, AI-enhanced assessments provide precise results and faster processing. By using Natural Language Processing (NLP) for automated grading, every student is evaluated against the same consistent criteria. AI offers a transformative path toward a fairer educational landscape for several reasons. Secondly, AI promotes equity through personalization. Firstly, AI enhances objectivity. While traditional methods have long served us, they often suffer from being time-consuming and subjective.
