

It is ovoid in shape and measures approximately 10 – 20 μm . This stage occurs in the intestine of cat, the final host when *Toxoplasma* success to produce the infection, which revealed in the feces of the infected cat, sporulation occurs outside the body in the environment, especially in soil, vegetables, and house thresholds (Frenkel, 1991). Sporulated oocysts are remarkably resistant and can survive in soil for several months and resist the stomach juices (Mims et al., 2004).(1).
