

functions, organization in line and perceived QoL among adults with LD and a matched control group; (b) to examine the relationships and predictive relationships between these variables in the group with LD using concepts from the ICF model. The inclusion criteria were: 20–50 years of age, mother tongue level of Hebrew reading and writing, intact vision and hearing or corrected with an aid, without motor or neurological disabilities, generally healthy with no chronic diseases or significant injuries that could influence daily activities and QoL. Data was collected between March 2011 and August 2012. The researcher met with each participant individually in a quiet location and obtained a signed written informed consent. Each participant completed a socio-demographic questionnaire followed by an extensive set of evaluations and questionnaires. Participants A convenience sample of 110 adults from the Southern participated
