

Enterprise resource planning (ERP) makes use of sophisticated software to integrate data from many departments and present it on a consolidated platform. The challenge for healthcare enterprises is to minimize operational expenses without affecting patient care. An ERP system aids health providers in overcoming these obstacles by enhancing efficiency and accuracy across the board. With an ERP, departments can continue to use their systems while also having access to documents from other areas via a single application and interface. Traditionally, health care providers utilized separate software systems to manage data in each department. (Multiview, 2021)
