

There are few or no trees on grasslands. Animals such as zebras, elephants, and lions live on savannas. Small animals and insects, such as rabbits, snakes, and grasshoppers, live there also. Larger animals, such as whales, sharks, and dolphins, also live in the ocean. Prairies and savannas are two types of grasslands. Savannas are located near the equator. Prairies are in more temperate areas. Animals like bison, deer, and horses live on prairies. The soil is good for planting crops. But this means that there are not as many grasslands on Earth as there used to be. The ocean biome is the largest biome on Earth. Earth has many different biomes with a variety of plants and animals. People have turned most prairies into farms.
