

Cybercrimes cause great losses to enterprises and companies in the form of material losses and losses in systems, so that the criminal penetrates the network systems of enterprises and companies and obtains valuable information, especially corporate systems, and then uses the information to serve his personal interests, which consists in stealing funds and destroying the company's supporting systems in the management process, causing serious losses to the company or organization. Cybercrimes related to the hacking of networks, accounts and systems negatively affect the state of the country's economy, and also cause many problems related to the threat to the country's national security if they are not properly controlled and combated. the percentage of cybercrimes and information crimes around the world is 170%, and the percentage is increasing day by day, which puts us all at imminent risk due to violations and hacking of systems and accounts.
