

Just 50 years ago, we finally ventured to the moon. Herds of the endangered Schabowski, his horse, now roam freely through the once busy city. Most surprising of all, perhaps the top predators of these forests as reappeared wolves, hunters like these would only return if their prey and the surrounding forest is also thriving. And nowhere is this dependence more apparent than in India's western GATT's, this globally important habitat contains a third of all animal species found in India. They've seen most frequently and most easily on Crosslands, but in fact, these open forests are their preferred habitat browsing elephants open up a forest. In western Alaska, both in spring and as now in autumn, salmon, having left the ocean, swim up rivers to reach their ancestral spawning grounds. The forest also benefits from these squabbles because even a defeated hornbill will spread seeds over white areas as he searches for his next meal. This is not a monkey, but a distant relative, allemande, and there are at least 40 different kinds of lemurs, all unique to Madagascar, and all endangered lemurs are crucial to the forest. They feed on the fruits of many kinds of tree, and in doing so they distribute the seeds which will emerge unscathed through their droppings. They are less fussy than the caterpillars, they will eat every part of the tree and a hungry elephant can munch to 200 kilos of vegetation in a day. It stretches eastwards across Russia for thousands of kilometres and now in the middle of winter, it's largely silent. Poaching has taken the Siberian tiger to the brink of extinction, but since the 1980s, their numbers have slowly increased. It stretches eastwards across Russia for thousands of kilometres and now in the middle of winter, it's largely silent. Poaching has taken the Siberian tiger to the brink of extinction, but since the 1980s, their numbers have slowly increased. It contains 750 billion trees and it stores over 40 percent of the world's carbon, making it a vital element in the fight against climate change. Hidden in the vegetation of the moist forest floor is a richly populated underworld. Once pens, he hangs on for she may take several hours to discharge all her ex. Other males are only too eager to displace him if they can. Light streaming down through the newly opened canopy provides the energy for a surge of new growth. But a few monkeys travel very far if plants are to distribute their seeds across great distances, they need another kind of transport. Madagascar has a forest dominated uniquely by one of the oldest trees baobabs, the island has been isolated for over 80 million years. Most of the year, forces are solitary, but in the breeding season, they assemble in a way that is all their own and each particular female takes up residence in a special mating tree with. They feed on tree sap, absorbing the part they need and excreting the rest as a sweet liquid, sometimes known perhaps flatteringly as Honey Dew. Now, studies have shown that there are seven times more wolves inside the exclusion zone than outside it. No unprotected human being can stay here for long without lethal risk. If we choose to give Forest's time and space, they could recode the Earth with lots of the rich and varied communities of animals and plants, of which we have so recently Walbridge. This series will celebrate the natural wonders that remain and reveal what we must preserve to ensure people and nature thrive. A male Siberian tiger patrols the territory of almost 2000 square kilometres, and it has to do so if it is to find enough prey to keep itself alive during the long winter. This series will celebrate the natural wonders that remain and reveal what we must preserve to ensure people and nature thrive. A male Siberian tiger patrols the territory of almost 2000 square kilometres, and it has to do so if it is to find enough prey to keep itself alive during the long winter. The boreal forest may be the last, but the places where the

salmon spawn are known to all the predators. Competition is so vigorous that the females in the center of these riding bulls have been known to drown for lack of their. The wind scouring the newly exposed forest floor kicks up dust devils of ash. The older, well-established redwoods have survived, protected by the thick fire-resistant bark. This natural resilience is essential to the continued health of these forests. Three tornadoes have wings that are almost two meters across, and they enable the birds to travel long distances in search of food. Phone bills feed on the food to 40 or so different kinds of trees and transport the indigestible seeds they contain all over the Western cats. This aerial jousting between males has never been filmed before and its purpose is not really understood. At the height of the dry season, the mambo attracts animals from all across southern Africa. In his absence, they browse on the abundant leaves and branches of the male. During that immensity of time, its animals and plants have evolved into forms quite different from any elsewhere. Within only 20 years, Sanchez recorded populations of animals similar to that in the wilder parts of Europe. The dramatic recolonization of Chernobyl in the space of only 30 years is proof of forests, extraordinary resilience. Over half of all the world's trees, evergreen and deciduous, stand in these great assemblies. For many of us, there are places of mystery and darkness. They are key to our climate and home to countless unique species. A pine cone pine nuts provides vital energy during the winter months. Over half of all the world's trees, evergreen and deciduous, stand in these great assemblies. For many of us, there are places of mystery and darkness. They are key to our climate and home to countless unique species. A pine cone pine nuts provides vital energy during the winter months. These rare glimpses reveal that their future still depends on having vast areas of forest. The boreal forest extends from Russia and east across Europe to North America. This far north, the forests can support very few animals compared to the rainforests of the tropics. Their journey from the sea into the forest represents the greatest transfer of nutrients from one habitat to another anywhere on Earth. The fish are crucial seasonal food for all the predators that live in this forest. Females, even when young, are larger than the males. If she can survive, she will have gained a place in one of the greatest and harshest forests on Earth. Not so long ago, these great trees grew throughout the Pacific Northwest. The conditions are less harsh, winds bring in warm, humid air from the Pacific Ocean, so the trees are able to grow the year-round. Every spring, he's driven by a mysterious urge to return to the pool where he hatched as a tadpole. By the end of the summer, the sun has baked the forest so intensely that they are as dry as Tinder. Lion tailed macaques. The fix themselves, although they taste nice, are not, in fact better nutritious, so the hospitals have to eat great quantities of them. The winner is able to demonstrate his strength and skill to visiting females. It's particularly important for home builders to get the best pairing because once established, the bond between male and female will last a lifetime. It stretches for over a thousand miles from Angola in the west to Mozambique in the east. These Mopani worms are not worms, of course, but caterpillars. And it's also an excellent place in which to bring up pups, the puppies greet the adults returning from a hunt with great excitement. Playing is important for the youngsters, for us, they do so they establish the social bonds that they will need when they start to hunt together as a team. Never has it been more crucial for the survival of this endangered species than now. The forest even has its own specialized Limor Hunter. They can go to a length of one and a half meters, and it's very seldom seen in the wild. The forest even has its own specialized Limor Hunter. They

can go to a length of one and a half meters, and it's very seldom seen in the wild. With its top predators distracted, the rest of the forest animals can go about their normal nightly business undisturbed. These are immature leaf bugs, a species found only here in Madagascar. And how did you, in turn, provides food for a particular species of small lemur? But our planet's forests, if given the chance, are almost unbelievably resilient. Forests.
