

The idea of robots has moved from the realm of science fiction to become a tangible part of our lives, thanks to breakthroughs in technology. Firstly, advancements in artificial intelligence have enabled robots to carry out intricate tasks that once demanded human intelligence, such as adapting to new circumstances and improving their abilities over time. Sectors like manufacturing and transportation are already experiencing a move towards the use of robotic labor, which could result in the replacement of human workers. Secondly, the growing presence of robots in the workforce poses the risk of job losses due to automation. Lastly, the creation of autonomous weapons brings up ethical questions about the role of robots in combat. This is showcased in the creation of AI that can learn from experience. company the development of intelligent machines.
