

Summarize in ten lines Amnesia means the inability to remember or retrieve information or events that you had to store it in your memory and it may be temporary or permanent. WHAT ARE THE REASONS OF AMNESIA? Neurodegenerative diseases, including Alzheimer's disease, Parkinson's disease, and Huntington's disease, can cause progressive memory loss and amnesia due to the degeneration of brain cells and disruption of normal brain function. Amnesia can occur as a result of traumatic brain injuries, such as those sustained in accidents or falls, which disrupt the normal functioning of the brain and lead to memory loss. Taking medication: Sometimes, doctors may prescribe medications to help manage the specific causes of amnesia. 1.2.3.4.5.4.
