

Let's imagine a strange but fascinating future: a world where words no longer exist. Scientists are developing brain-computer interfaces that allow people to send signals directly from their minds. Misunderstandings could also become more common, since symbols and emotions can be interpreted in different ways. But if words disappear, communication will not end -- it will transform. A single emoji can show happiness, sadness, or love in seconds. These symbols are becoming a kind of universal language that everyone can understand. Imagine sharing a thought or emotion instantly, without needing any words. This could remove language barriers and make communication faster and more direct than ever before. Poetry, literature, and cultural stories depend on language. No speaking, no writing, no texting. At first, it sounds frightening, because language is the foundation of human connection. People often use emojis, pictures, and body language to express feelings more quickly than words. In the future, technology may push communication even further. We may lose part of our culture, but we will also discover new ways of understanding each other -- through images, technology, and perhaps even direct mind-to-mind connection. We can already see the beginning of this change. But if words disappear, we will also lose something important. Without words, it may be harder to express deep ideas, beauty, or imagination.
