

Management Information Systems (MIS) work to enhance decision-making processes and operational efficiency, helping to achieve sustainable development goals by providing data-driven insights and enabling organizations to monitor sustainability efforts and track progress. The Green Riyadh Initiative uses Management Information Systems to enhance sustainability in Riyadh by improving infrastructure, promoting environmentally friendly practices, smart urban planning, utilizing technology in parks, sourcing sustainable materials, and real-time environmental monitoring. MIS simplifies logistical services, reduces waste and carbon emissions through data analytics, while enhancing urban sustainability by managing traffic flow and infrastructure.
