

Exploring the ocean and space are important for advancing our world, but which one is more important and has greater benefits? While space exploration is fascinating and can lead to major scientific developments, it is very costly. On the other hand, the ocean has already provided us with medicine and produces oxygen. Additionally, exploring the ocean can lead to practical benefits like food, jobs, and fuel. Overall, it is clearly better to give more attention, time, and money to explore the ocean than outer space. It is cheaper and more useful. Exploring oceans can bring more benefits in many ways than any benefit from space exploration.
