The World Wide Web is a highly used tool by Internet users. Although some of the more advanced applications of the Web may require a little more technical skill, those that are ambitious can create a Web page with a variety of features. It is a collection of "Web pages" created by Hypertext Markup Language (HTML) and viewed by Web Browsers. Web pages contain anything from personal information to broad topics of interest. Who can create a Web page? Anyone who has Internet access can create it. If you have "surfed the net" you may have encountered pages that introduce a person, provide information about their personal interests, or may even contain a resume advertising themselves for the job market. Web pages provide a means for companies to advertise their products, post available job positions, and furnish information on the latest technical developments. The debates provide suggestions and even solutions, but there is no true way to regulate a Web page's content. Political candidates advertise there views to inform the voters. Web pages supply researchers with another method to inform the public of breaking research topics. There are several ongoing discussions throughout the Internet community concerning Web page design.
