

Audiology practice Summary of audiology services and the percentage of audiologists providing these services are shown in Figure 2. One audiologist performed otoacoustic emissions (OAEs) measures on all their patients whereas half of the audiologist respondents reported performing OAEs depending on the patient. Of the total respondents, six audiologists performed auditory processing disorder (APD) assessments, but no information was provided about the type of tests or management and whether these tests were in Arabic or English. The remaining respondents reported performing vestibular evoked myogenic potential, videonystagmography, and/or caloric testing. Of the total participants, 10 audiologist participants performed otoscopy routinely on all patients whereas four of them reported performing otoscopy most of the time. Auditory brainstem response (ABR) and auditory steady-state response (ASSR) were used by 11 (47.82%) audiologist respondents.
