

Supply Chain Management (SCM) is referred to as synchronisation of various processes. It is a network of transportation and warehousing processes that ensures the procurement, distribution and movement of materials from the point of origin to the point of consumption. Organisations need to formulate that SCM resources, raw materials, and components are gathered and organised for producing finished products to be delivered to end customers on time. An efficient supply chain benefits customers by reducing the incidence of stockouts and providing the assortment of merchandise as required. SCM includes logistics but has a more comprehensive and strategic perspective, including inventory management and vendor relations. The processes entail from connecting with suppliers who are responsible for providing products, services and information so that quality product is availed by the customers. SCM endeavours the profitable progress of organisations by timely processing of customer orders and meeting their expectations. Supply chain is an integral part of the organisation as it ensures the product is readily available at the apt time at the point of consumption.
