

Training at the airport nursery is fun and useful in our daily life about the importance of preserving plants not only for their aesthetic appearance but also for our health in terms of exchange of auxin and carbon dioxide and protection from sunlight. We learned about the types of indoor and outdoor plants, as well as testing the acidity and salinity of water and soil, irrigation methods, types of reproduction, how to identify missing elements through the shape and color of the leaf, types of soil, organic and inorganic fertilizers, and rooting methods, whether with natural materials or stimulants such as hormones. Both go through stages of growth and development, with humans transitioning from childhood to adulthood and plants from seed to mature plant. Despite differences, plants and humans share basic features supporting life. Both plants and humans seek to communicate and protect themselves and others.
