The existence of under–exploited gas reserves in the kingdom has been one of the strongest arguments for developing gas–based heavy industries.5 In general terms, the theory indicates that Saudi Arabia should establish and promote industries primarily based on natural gas and I or oil. For example, according to the Heckscher–Ohlin theory of international trade, a country tends to have lower comparative costs in the commodity that uses the largest amount of the relatively cheapest factor in its economy. Gas – especially the dry gases, methane and ethane – is an expensive product to transport, thus making it sensible to look for more productive uses for its exploitation. These considerations provide the fundamental rationale for specialization.
