

Because Google Translate (GT) is the most frequently used and popular machine translation (MT) tool for both Arabic and English, it was employed in a number of research, including Al-Kabi et al. (2013), Abdulhaq (2016), and Jabak (2016) (2019). There are eighty-four meaningful sections in the ST. The results indicate that none of the three translation engines was able to accurately translate the STs, with Microsoft Bing translation being favored as the best translation when the TT was corrected using the two translation variables of fidelity and intelligibility.
