Nomenclature of alkene and alkyne: 1–Define the parent chain: it is the largest chain on condition that it comprises unsaturated links and hence the compound 's primary name is based on its amount etc when the complex unsaturated bonds are repeated.7–In the case of stereo composition (in English: stereoisomers) in machines (CIS or TRANS), the mark to be put before the mark must be engraved2–The unsaturated links must take the lowest number in the number when counting the parent chain, and write the position of the unsaturated connection in the mark.
