

Air and water pollution has been the highlight of all major international level meetings. Similar to how human health is impacted, the planet's health is likewise impacted when we suffocate its breezes and contaminate the water that runs over it. Estimates say that the proportion of the global burden of disease associated with environmental pollution hazards ranges from 23 percent (WHO–1997) to percent (Smith, Corvalan, and Kjellstrom 1999). Poisonous substances released from industries that harm the environment, such as chemical plants, have been linked to a number of diseases and disorders that were previously undiagnosed in humans. the recent levels of air and water pollution witnessed around the world has been of serious concern for all the people, different environmentalists like Greta Thunberg, etc. have raised their voices forcing the governments to change their policies regarding pollution. When air and water pollution reach an extreme degree, it becomes irreversible.
